

Distribution of Needles & Syringes in Western Australia from 1987-2004

A total of 32,615,229 sterile needles and syringes were distributed from March 1987 to December 2004, of which 59.5% were sold through retail pharmacies and about one third distributed through needle and syringe exchange programs. There was a mean metropolitan rate of 20,905 needles and syringes per 10,000 population for all of the 19 localities in the Perth metropolitan area. The highest mean annual rate was in the Mount Lawley-Maylands area, with a rate of 50,885 needles and syringes per 10,000 population. A ranking of the 19 localities found rates well above the mean metropolitan rate for the localities of Mount Lawley-Maylands (2.43 times higher), Bickton-Fremantle (2.1 times higher), Leederville-Tuart Hill (2.08 times higher) and Victoria Park-Redcliffe (1.49 times higher). There was a mean country rate of 10,551 N&S per 10,000 population, with rates well above the mean country rate for Kalgoorlie-Boulder (3.58 times higher), Carnarvon (2.38 times higher), Karratha (2.30 times higher), Bunbury-Eaton (2.01 times higher) and Geraldton (1.94 times higher).

Summary

In Western Australia (WA) the majority of needles and syringes (N&S) sold to injecting drug users (IDUs) are Fit-pack products which incorporate a self locking mechanism for the retention of used N&S for safe disposal.

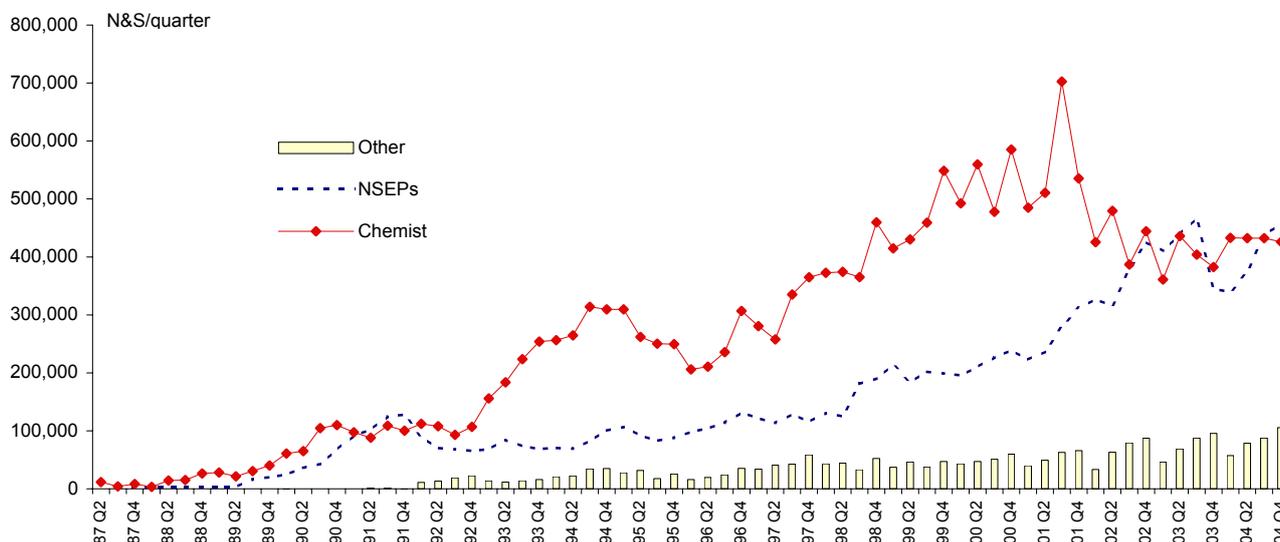

The remaining third of N&S are distributed through the mobile and fixed needle and syringe exchange programs (NSEPs) which have rates of 95% of return of used injection equipment for both the WA AIDS Council (WAAC) and the WA Substance Users' Association (WASUA). (See Table 1, page 2.)

From 1997 to 2004 there was a steady increase in the annual number of N&S distributed, reaching a total of 3.66 million in 2004 - from a mean of 195 per day in 1998 to a mean of 10,022 per day in 2004 (Table 2, page 4).

A total of 32,615,229 sterile N&S were distributed in WA from March 1987 to December 2004, six out of ten (59.5%) were sold through chemists and about one third distributed through NSEPs (Table 2, page 4).

Of the 10,713,619 N&S distributed through mobile and fixed NSEPs, 60.9% were distributed through mobile NSEPs and 39.1% through NSEPs operating at fixed sites. There were few N&S distributed through hospitals

Figure 1
Quarterly totals of needles and syringes distributed by type of outlet, WA, 1987-2004

(3.2%), other outlets such as community health centres, nursing posts, community based organisations (eg Magenta formerly known as Phoenix) and public health units and through vending machines (1.7%).

From the March quarter 1987 to the end of 1992 similar numbers of N&S were distributed through both chemists and NSEPs. From 1993 there was an expansion in the N&S program based at chemists, which reached 702,553 in the September quarter 2001 and then fell to 360,998 in the March quarter 2003. Since the June quarter 2003 distribution of N&S through chemists has stabilised at about 430,000 per quarter.

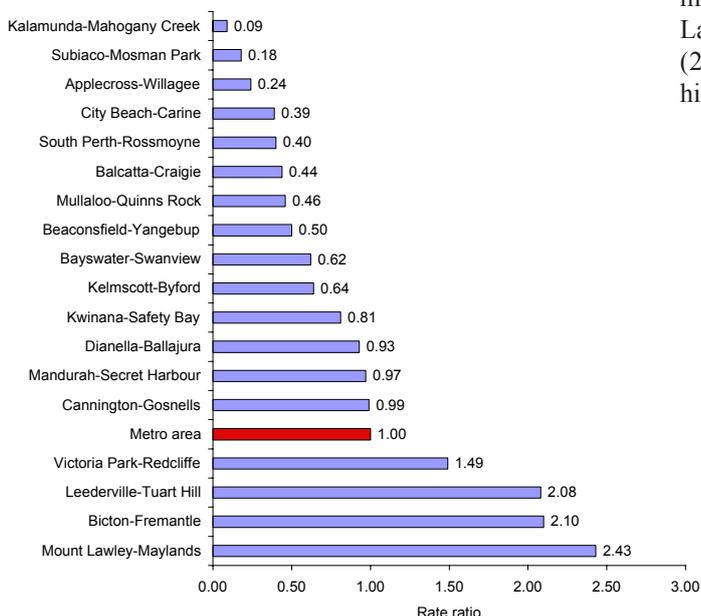

The number of N&S distributed through NSEPs steadily increased from mid 1998 to a peak of 467,255 in the September quarter 2003 and since mid 2004 more N&S have been distributed through NSEPs than through chemists. (See Figure 1, page 1.)

Figure 2
Mean rate ratios of distribution of needles & syringes, metropolitan localities, 2000-2004

Metropolitan Area

A study of metropolitan data for the five year period from 2000 to 2004 identifies variations in the metropolitan area on the rate of sales of N&S in 19 different localities.

In the Perth metropolitan area there were three localities which had a mean of more than 200,000 N&S distributed per year - Dianella-Ballajura (284,997), Cannington-Gosnells (216,263) and Victoria Park-Redcliffe (205,101). (The Perth inner city area has been excluded as within this locality there are a number of mobile NSEP sites which distribute high volumes of N&S.)

There were two localities in which there was a mean of between 150,000 and less than 200,000 N&S distributed per year - Mount Lawley-Maylands (176,281) and Kwinana-Safety Bay (151,472).

There were five localities in which there was a mean of between 100,000 and less than 150,000 N&S distributed per year - Bayswater-Swan View (149,402), Bicton-Fremantle (128,223), Leederville-Tuart Hill (126,708), Mandurah-Secret Harbour (120,068) and Mullaloo-Quinns Rock (108,196).

This study also found there was a mean metropolitan rate of 20,905 N&S per 10,000 population for all of the 19 localities in the Perth metropolitan area.

Excluding the Perth inner city area, the highest mean annual rate was in the Mount Lawley-Maylands area, with a rate of 50,885 N&S per 10,000 population. (It is possible that this rate could be inflated because of the location of a 24 hour pharmacy in Mount Lawley which may have been accessed by persons living outside of this locality.)

The ranking of mean rate ratios of the 19 localities presented in Figure 2 shows rates well above the mean metropolitan rate were reported for the localities of Mount Lawley-Maylands (2.43 times higher), Bicton-Fremantle (2.1 times higher), Leederville-Tuart Hill (2.08 times higher) and Victoria Park-Redcliffe (1.49 times higher).

Regional Centres

The mean country rate was 10,551 N&S per 10,000 population, which was about half the mean metropolitan rate of 20,905.

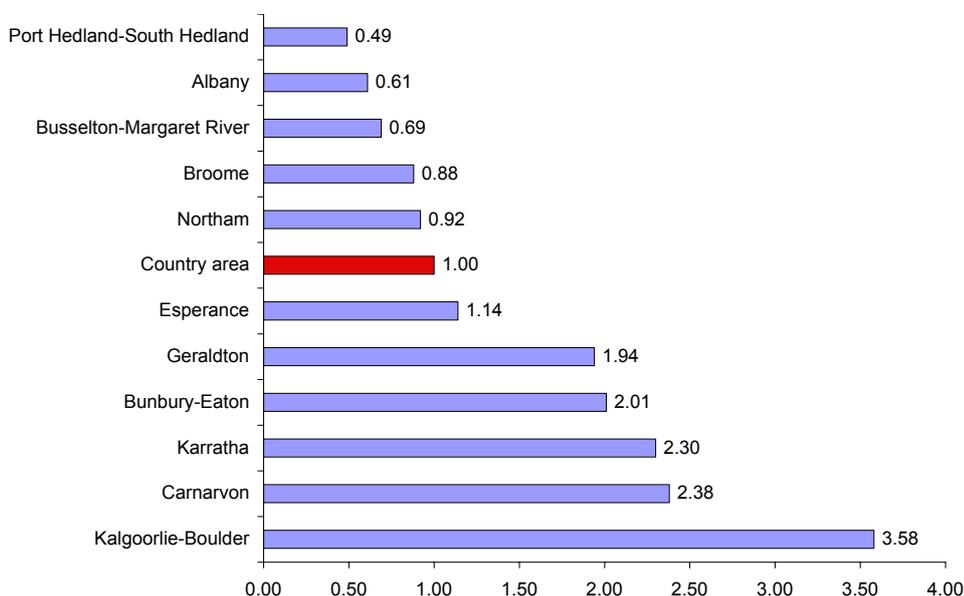

Annual N&S data from 1993 to 2004 for 11 major regional centres identifies trends and patterns in the distribution of N&S outside the Perth metropolitan area, with the highest mean annual rate in Kalgoorlie-Boulder (37,763). There were four other regional centres with rates above 20,000 N&S - Carnarvon (25,065), Karratha (24,251), Bunbury-Eaton (21,195) and Geraldton (20,422).

There were marked quarterly fluctuations in Broome, Port Hedland, Karratha and Carnarvon due to supplies being ordered in large quantities to cover demand during the holiday season when availability of stock is restricted. In a number of centres such as Karratha the sharp quarterly jumps in N&S distribution is due to the centralisation of ordering of supplies through Public Health Units.

In some regions such as the Kimberley, the N&S distribution figures for the main regional centre include distribution to other outlets located outside of the centre due to the centralisation of ordering of supplies by Public Health Units.

The ranking of mean rate ratios for the 11 regional centres over the five year period shown in Figure 3 shows rates well above the mean country rate for Kalgoorlie-Boulder (3.58 times higher), Carnarvon (2.38 times higher), Karratha (2.30 times higher), Bunbury-Eaton (2.01 times higher) and Geraldton (1.94 times higher).

Figure 3
Mean rate ratios of distribution of needles & syringes, selected country localities, 2000-2004

Bunbury

From 1993 to the June quarter 2000 the number of N&S steadily increased to 18,820 in the June quarter 2000 and then dropped to 3,590 in the September 2000. Since 2001 the number of N&S has steadily increased and reached 39,664 in the December quarter 2004.

Factors that have contributed to the recent growth in utilisation of N&S in the Bunbury area has been the commencement of a mobile NSEP operated by WASUA in 2001. (By 2003 just over half of all N&S in Bunbury were provided by WASUA.) Also, since 2002 N&S have been provided on an after hours basis from the Bunbury Regional Hospital.

Busselton-Margaret River

There has been a steady increase in the number of N&S distributed from 1993 reaching 10,076 in the December quarter 2004.

Albany

Relatively few N&S were distributed from 1993 to early 1999, peaked in mid 2001, declined throughout 2002 and have since increased to 7,255 in the December quarter 2004.

Kalgoorlie-Boulder

There have been increasing numbers of N&S distributed throughout the period from 1993 to the December quarter 2004. Since 2001 a N&S vending machine has operated on an after hours basis at the Kalgoorlie Regional Hospital, which has reduced the demands for N&S during the day at the hospital's Emergency Department.

In conjunction with the reduced role of the hospital as a source of N&S demand has grown for N&S provided at no cost through the Public Health Unit during the day.

Esperance

There were very few N&S distributed up to mid 1997 and have since increased to 7,578 in the December quarter 2004.

Geraldton

From 1993 to mid 1998 the number of N&S remained relatively constant and then increased to 24,249 in the December quarter 2004. As the Midwest Public Health Unit commenced distribution of N&S in the March quarter 1999 N&S data from the beginning of 1999 includes figures for outlets outside the main regional centre. The Geraldton Regional Hospital also commenced distribution of N&S in the June quarter 2003.

Carnarvon

Few N&S were distributed up to late 1997 and then there has been a trend of steady increase up to the December quarter 2004 (11,000). The short term peaks in N&S distribution since 2001 are believed to be related to ordering to cover holiday periods of restricted availability of stock.

Port Hedland

From 1993 up to the December quarter 1999 (4,750) the number of N&S distributed steadily increased. From late 1999 to mid 2002 the number of N&S declined and have since increased slightly to 4,400 in the December quarter 2004.

Karratha

Very few N&S were distributed up to the end of 1999 and since the beginning of 2000 the number of N&S has fluctuated markedly, with an underlying pattern of increasing growth.

Broome

Relatively few N&S were distributed up to early 1998 and then gradually increased up to early 2001. There has been a gradual decline since a peak in late 2001 with 995 in the December quarter 2004.

To view or download detailed data tables and figures and a description of the methodology associated with this report go to the Drug and Alcohol Office website.

Note: 'Other' includes community health centres, nursing posts, community based organisations (eg Magenta formerly known as Phoenix) & public health units (PHU). 'Mobile NSEP' includes Derby/ Yerrigan which operated a mobile NSEP from 1996 to 1998 and since 2001 includes the service provided by WASUA in Bunbury (no other mobile NSEPs operated in 2000). 'Vending machine' refers to vending machine which operated in East Perth up to 1999 and then a new service commenced in Kalgoorlie in 2001. Recent increases in 'other outlet' reflects increased distribution of Fitpacks by PHUs to hospitals within their regions.

Public Health Benefits of NSPs

Needle and syringe programs (NSP) are a major public health measure to reduce the transmission of blood borne viruses (BBVs). Australia has maintained a low rate of HIV transmission amongst people who inject drugs via the provisions of sterile injecting equipment and information since the late 1980s. In Western Australia (WA) the *Poisons Act 1964* was amended in 1994 to enable approved organisations to provide a NSP.

Injecting drug users (IDUs) have access to sterile injection equipment and information through the needle and syringe exchange programs (NSEP) operated by the WA AIDS Council (WAAC) and the WA Substance Users' Association (WASUA).

The WAAC provides a mobile service which visits 12 sites each week in the Perth metropolitan area. WASUA provides a fixed site exchange program in the Perth inner metropolitan area in Northbridge, as well as a mobile service in Bunbury, a major regional centre in the South West of the State. Injecting equipment is provided from these NSEP at no cost to clients upon the return of used items, otherwise a cost recovery charge applies.

Sterile injection equipment is also sold by pharmacies in both metropolitan and non metropolitan areas and distributed by a number of non metropolitan hospitals, usually after pharmacy trading hours or where pharmacy provision is not available. Needles and syringes (N&S) are also sold from a vending machine based at the Kalgoorlie Regional Hospital which provides an after hours service.

In 2002 by the National Centre for HIV Epidemiology and Clinical Research auspiced a research project to ascertain the return on the investment in NSP in Australia. The research involved an ecological study of changes in HIV and HCV prevalence among IDUs by comparing cities with and without NSP.

"The analysis found that cities that introduced NSP had a mean annual 18.6% decrease in HIV seroprevalence, compared with a mean annual 8.1% increase in HIV seroprevalence in cities that had never introduced NSP ... Overall the results indicated little change in HCV prevalence before NSP were introduced, followed by a decline after the introduction of NSP."

The research also demonstrated the economic effectiveness of NSP in Australia in 2000. The report includes a review of the effectiveness of NSP by analysis of 103 studies in the international literature. This established that cities which had introduced NSP had a mean annual decrease in HIV seroprevalence of 18.6% among IDUs, compared to a mean annual increase of 8.1% seroprevalence in cities that had never introduced harm reduction programs.

A study of the frequency of use of sterile N&S by nearly 600 active IDUs in seven US metropolitan cities found a median of three injections for the most recently used syringe and that one in five IDUs had used that syringe only once.²

An interview survey of 8,400 IDUs in 1998 at 18 different sites in the United States found high rates of re-use of used injection equipment, with one third of the respondents using injection equipment they knew had been previously used, with a mean frequency of transfer of syringes of 7.6 times in the past 30 days.³

The *AIVL national injecting equipment disposal study* was published in April 2002, as part of a two year program by the Australian Injecting and Illicit Drug Users League (AIVL) to investigate the disposal of injecting equipment.

This report shows that IDUs have a high level of concern about the safe disposal of used injecting equipment and that the small proportion of incidents where inappropriate disposal occurs is frequently due to unplanned use in unfamiliar environments. The study also found that inappropriate disposal is closely related to a lack of acceptable options for disposal, the possibility of threat of police interference or insufficient knowledge of safe disposal options.⁴

The most recent report of the *Australian NSP survey: National Data Report 1999-2003* was published in June 2004. Nationally from 1999 to 2003 the report established an increasing use of new N&S by PWID and decreasing rates of N&S re-use in the month preceding the survey.

Methodology

Previous publications

This report updates N&S data previously published in *Statistical Bulletin No. 3* (December 1996), *Statistical Bulletin No. 6* (February 2000), *Statistical Bulletin No. 7* (March 1999), *Statistical Bulletin No. 14* (July 2001) and *Statistical Bulletin No. 18* (December 2003).

Source of data

As monthly records are maintained of the number of N&S ordered by each individual pharmacy, it is possible to collate the number of N&S by outlet and locality for each pharmacy based NSP.

In early 1999 the operator of the mobile NSEP, the WA AIDS Council, introduced separate recording of the number of N&S distributed at each of the sites where the van operates on different days of the week. With the enhancements to the mobile NSEP data, it was possible to undertake an analysis of the total number of N&S distributed in the years 2000 to 2003 in the Perth metropolitan area based on postcode locality for all outlets.

Interpretation of data

The metropolitan area was broken up into 18 localities based on groups of adjacent postcode districts. Each locality contains the total number of N&S distributed in that geographical area. A postcode district may encompass more than one suburb. This does not mean that N&S were distributed from outlets in all the suburbs listed. The suburbs within each locality are listed in Appendix 2.

There are limitations in using postcode data to identify possible differences between localities in the rate of access to NSPs by IDUs since, as in some areas, chemists do not retail N&S. Also some areas may show higher volume of distribution than other areas because IDUs have come from adjacent suburbs to access the nearest outlet.

While a local pharmacy may retail N&S as Fitpacks®, SharpzKitz® and Sterafit® packs, costs may be determinant of clients accessing pharmacy based versus other types of NSP.

Caution should be exercised in making inferences about underlying patterns of injecting drug use based on the distribution of N&S by postcode data, as some outlets may be located on major transport routes.

Another caution in interpreting data is that a number of pharmacies located in the metropolitan area provide after hours access to N&S and this may attract a greater number of clientele from outside that locality.

Furthermore, WASUA's fixed site NSEPs distributes very large numbers of N&S in the Perth inner city area. While this could be misinterpreted as indicating Northbridge is an area in which high levels of injecting drug use occurs, a high volume of N&S distribution does not indicate more prevalent injecting drug use by residents of the area.

Indeed, the contrary may be the case, as Northbridge is the Perth metropolitan area's major late night entertainment district and has a concentration of night clubs and bars. It also contains a number of boarding houses, hostels and overnight shelters which are used by a transient population.

Note: Minor discrepancies occur between annual and quarterly totals in Tables 1, A1 and A2 prior to 2001 due to extensive cleaning of the database. Therefore, information reported in earlier publications may not accurately reflect revised totals published in this report.

Acronyms used

BBVs	Blood borne viruses
IDUs	Injecting drug users
N&S	Needles & syringes
NSP	Needle & syringe program
NSEP	Needle & syringe exchange program
WASUA	WA Substance Users' Association
WA	Western Australia

Data revision

Data presented in this bulletin may vary from earlier publications because the datasets operated by the department and other organisations who also provide data used to compile this report may have been revised due to cleaning, recoding and/or updates of systems.
