

Drug Related Psychiatric Outpatient Mental Disorders Due to the Use of Psychoactive Drugs (excluding alcohol) Western Australia: 2000 - 2006

Introduction

This report summarises annual and quarterly trends in outpatient treatment episodes at both private and public mental health clinics and hospitals in Western Australia (WA) from July 2000 to December 2006.

These episodes involve disorders from within the broad diagnostic group referred to as *Mental and behavioural disorders due to psychoactive substance use*, covered by the ICD-10 codes F10-F19. The ten disorders within this group are all attributable to the use of one or more psychoactive substances, which may or may not have been medically prescribed, of which seven were specifically examined for this study.

As this analysis is primarily concerned with admissions involving the use of illicit drugs such as cannabis, heroin and stimulants (ie amphetamines and methylamphetamine), it excludes the F10 (disorders due to use of alcohol), the F17 (tobacco) and F18 (volatile solvents) diagnostic groups.

This analysis involves a completed occasion of service where a principal diagnosis was that the disorder was due to the use of either opioids (F11), cannabinoids (F12), sedatives or hypnotics (F13), cocaine (F14), other stimulants including caffeine (F15), hallucinogens (F16), or multiple drug use and use of other psychoactive substances (F19).

Overview

Figure 1 (page 2) provides an overview of trends in the proportion for each group of total annual outpatient treatment episodes. (Because of the very small number of episodes for cocaine and hallucinogens these have been combined in the 'other drug' group). *Note: Data for the year 2000 which covers from July to December 2000 has been omitted from this analysis of annual trends.*

Annual trends

Overall, annual episodes increased from 2,432 in 2001 to 3,914 in 2006, an increase of 60.9% over the six year period (Table 1). Over the six year period trends for annual admissions were as follows:

- cannabis increased by 74.0% from 462 in 2001 to 804 in 2006;
- opioids increased by 64.6% from 130 in 2001 to 214 in 2006;
- sedatives/hypnotics increased by nearly four fold from 29 in 2001 to 105 in 2006;
- stimulants increased by 95.9% from 393 in 2001 to 770 in 2006; and
- multiple drugs increased by 42.3% from 1,371 in 2001 to 1,951 in 2006.

Version: June 2007

Table 1
Annual drug related psychiatric outpatient treatment episodes by drug group, 2001 - 2006

	Cannabis (F12)		Opioids (F11)		Sedatives/ hypnotics (F13)		Stimulants (F15)		Multiple drugs (F19)		Other drugs (F14, F16)		All drugs
	n	%	n	%	n	%	n	%	n	%	n	%	
2001	462	19.0	130	5.3	29	1.2	393	16.2	1,371	56.4	47	1.9	2,432
2002	551	18.7	155	5.3	65	2.2	483	16.4	1,644	55.9	43	1.5	2,941
2003	584	18.8	148	4.8	74	2.4	565	18.2	1,691	54.4	48	1.5	3,110
2004	615	18.8	179	5.5	69	2.1	655	20.1	1,686	51.7	60	1.8	3,264
2005	727	20.7	181	5.2	67	1.9	632	18.0	1,848	52.7	49	1.4	3,504

Table 1 also has trends from 2001 to 2006 in the proportion of total annual episodes by diagnostic group, as follows:

- disorders due to cannabis increased from 19.0% to 20.5%;
- disorders due to opioids were relatively constant accounting for one in 20 of all episodes;
- disorders due to sedatives/hypnotics accounted for 2% or less of all episodes;
- disorders due to stimulants increased from 16.2% to 19.7%; and
- disorders due to multiple drugs declined from 56.4% to 49.8%.

Throughout the period from the September quarter 2000 to the December quarter 2006 the majority of episodes involved males who accounted for between two thirds and three quarters of all episodes (Figure 2, page 3).

The quarterly trends from the September quarter 2000 to the December quarter 2006 involving opioids (F11), cannabis (F12) and stimulants (F15) in Figure 3 (page 4) show a similar upward trend in both opioid and cannabis related episodes, whereas opioid related episodes remain relatively constant over the period.

Quarterly trends in episodes involving sedatives/hypnotics (F13), cocaine (F14), hallucinogens (F16) and multiple drugs (F19) are shown in Figure 4 (page 4). It can be seen that the most frequent drug involved the multiple drugs group, which steadily increased from 299 episodes in the September quarter 2000 to 476 in the December quarter 2006.

Compared to the multiple drug group, there were relatively few quarterly episodes involving either the sedatives/hypnotic, hallucinogen or cocaine groups throughout

the period. With respect to the sedative/hypnotic group there has been a moderate growth from mid 2001 up to the present, whereas episodes involving the hallucinogen group remained relatively constant up to mid 2005 and then increased somewhat.

Age and sex characteristics

This section summarises age and sex related patterns with respect to opioid, cannabis, stimulant and multiple drug related disorders. More detailed information for these and other groups is contained in the Appendix of data tables and figures separately available from the Drug and Alcohol Office website.

Opioid disorders (F11)

For most quarters from the September quarter 2000 up to the present there was a greater number of male compared to female episodes. The most frequent age group was the 25 to 34 age group followed by the 15 to 24 and 35 to 44 age groups.

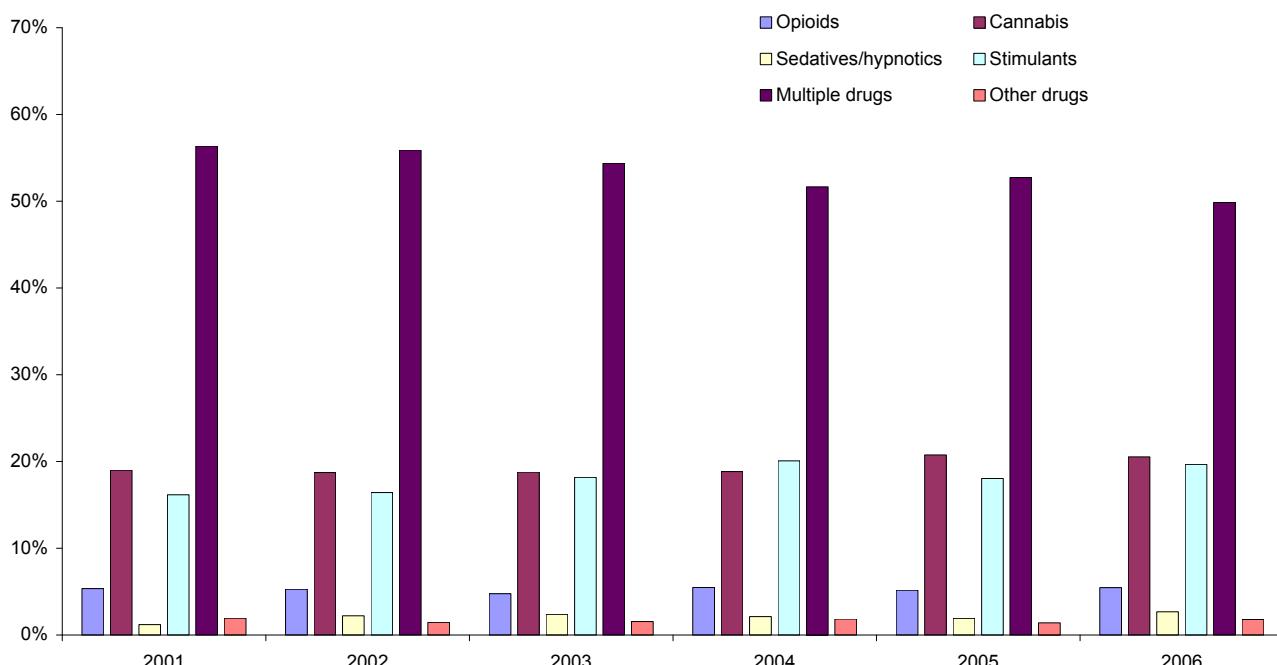

Cannabis disorders (F12)

The greatest proportion of episodes involved males, with about only one in four of all episodes involving females and a consistent pattern for the greatest number of episodes to involve the 15 to 24 age group closely followed by the 25 to 34 age group.

Stimulant disorders (F15)

There was a pattern of more male than female stimulant episodes for all quarters (except for the March quarter 2004), with about two out of three of all episodes involving males.

Figure 1
Proportion (%) annual drug related psychiatric outpatient treatment episodes by drug group
2001 - 2006

From the September quarter 2000 up to the March quarter 2003 the most frequent episodes mostly involved the 15 to 24 age group, however the number of episodes for this age group declined over the remainder of the period relative to the 25 to 34 age group, which steadily increased from early 2003. There was also a slight increase in episodes involving the 35 to 44 age group since early 2005.

Multiple drug disorders (F19)

There was a higher proportion of male than female multiple drug episodes throughout the period from the September quarter 2000 to the December quarter 2006 and that since mid 2003 the most frequent episodes involved the 25 to 34 age group.

Sub diagnostic groups

This section identifies trends within the various sub diagnostic groups for opioid, cannabis, stimulant and multiple drug related disorders. More detailed information for these and other groups is contained in the Appendix of data tables and figures separately available from the Drug and Alcohol Office website.

Opioid disorders (F11.0 - F11.9)

The most frequent type of opioid related episodes for most quarters involved the dependent syndrome (F11.2) sub diagnostic group, with some growth occurring in episodes of this sub diagnostic group since 2003.

Cannabis disorders (F12.0 - F12.9)

Throughout the period there was a dominant pattern that the majority of cannabis related episodes involved the psychotic disorder (F12.5) sub diagnostic group.

However, whilst quarterly episodes involving the acute intoxication, harmful use, dependent syndrome and other diagnoses sub diagnostic groups remained relatively constant over the period, there was a marked increase in episodes involving the psychotic disorder group.

Stimulant disorders (F15.0 - F15.9)

From the September quarter 2000 up to the December quarter 2006 there were relatively few quarterly stimulant related episodes involving acute intoxication, harmful use, dependent syndrome, withdrawal and other diagnoses.

Compared to a pattern of static quarterly episodes involving these sub diagnostic groups, there was a sustained and pronounced quarterly growth in episodes involving the psychotic disorder (F15.5) sub diagnostic group from the September quarter 2000 up to the present.

Multiple drug disorders (F19.0 - F19.9)

With respect to multiple drug related episodes there was a gradual increase in quarterly episodes involving the psychotic disorder (F19.5) sub diagnostic group from the September quarter 2000 to the December quarter 2006.

The second most frequent number of episodes involved the 'other' sub diagnostic group, (ie the F19.3 - F19.4 and F19.6 - F19.9 sub diagnostic groups), which increased from the September quarter 2000 up to mid 2003. They then remained relatively constant up to the end of the period.

Methodology

Caution should be exercised in interpretation of trends in data reported in this publication because:

- single consultations and group therapy consultations have been added together or occasions of service;
- inpatients include any separations in WA acute hospitals; and
- if outpatient diagnosis is not known then last known diagnosis is provided from another mental health episode.

Occurrences of service (OCS) are reported under the guidelines of the National Minimum Data Set (NMDS) for Community Mental Health, Department of Health. (*Community Mental Health Reference Manual & DOH Technical Bulletins for Mental Health & Non Admitted Care.*)

Inconsistent reporting of OCS by using old method mainly occurred due to problems in the Local Area Mental Health Information System (LAMHIS) data system. LAMHIS focused on health professional activity rather than clients, which does not meet the NMDS requirements. To overcome this problem a new reporting method was developed by Information Collection and Management in conjunction with Division of Mental Health.

Previous LAMHIS reports are not suitable to report OCS as they over report OCS by approximately 40%. The mental health online clinical information system (PSOLIS) records OCS to national standards and a reporting tool has been developed by Information Collection and Management in conjunction with Division of Mental Health.

Counting rules for an OCS in LAMHIS are as follows:

- one OCS will be reported by a clinician for a person if it is a continuous service;
- client related activities such as staff meetings, travel etc are not reported;
- if two or more health professionals are present at the same patient consultation it is counted as one; and
- continuous group sessions over one day are counted as one OCS when the patient is not present.

Counts of OCS in 2003/2004 and 2004/2005 may also be affected because of a number of other considerations.

Decreases in 2003/2004 and 2004/2005 were due to:

- Reduction in the over reporting of same day contacts in PSOLIS (now with a date and time stamp) when compared to LAMHIS (no time stamp).
- Introduction of a new computing system (PSOLIS) has meant a significant change in work practices which has caused a down turn in data collection standards in the short term.
- A number of day rehabilitation programs were without a computing system for several months due to the introduction of PSOLIS.
- Normal variation with changes especially in day programs numbers which have significant impacts on contact numbers.
- Seasonal affects, eg during Christmas.

Increases in 2003/2004 and 2004/2005 were due to:

- Improved compliance and quality assurance processes/reporting all contacts under new Commonwealth guidelines.
- Programs not reported in LAMHIS are now taken up in PSOLIS. There is now Statewide capture.
- Significant improvement in collection of OCS when patients are not present, eg OCS have risen significantly in this area.
- Seasonal affects, eg inpatient discharges and re-admissions during Christmas.
